

MU5MES01

Nonlinear structural mechanics by the finite element method.

1 - Introduction to FEM

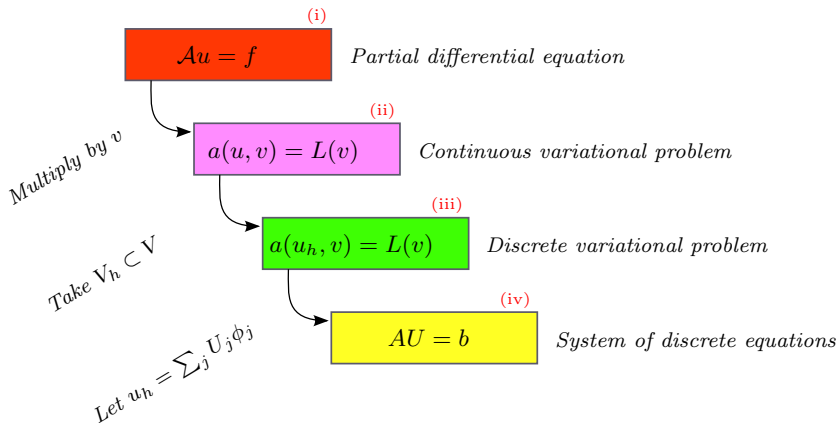

Corrado Maurini, based on slides from Anders Logg

What is FEM?

The finite element method is a framework and a recipe for discretization of differential equations

- Ordinary differential equations
- Partial differential equations
- Integral equations
- A recipe for discretization of PDE
- $\text{PDE} \rightarrow Ax = b$
- Different bases, stabilization, error control, adaptivity

The FEM cookbook

The PDE (i)

Consider Poisson's equation, the Hello World of partial differential equations:

$$\begin{aligned} -\Delta u &= f && \text{in } \Omega \\ u &= u_0 && \text{on } \partial\Omega \end{aligned}$$

Poisson's equation arises in numerous applications:

- heat conduction, electrostatics, diffusion of substances, twisting of elastic rods, inviscid fluid flow, water waves, magnetostatics, ...
- as part of numerical splitting strategies for more complicated systems of PDEs, in particular the Navier–Stokes equations

From PDE (i) to variational problem (ii)

The simple recipe is: multiply the PDE by a test function v and integrate over Ω :

$$-\int_{\Omega} (\Delta u)v \, dx = \int_{\Omega} f v \, dx$$

Then integrate by parts and set $v = 0$ on the Dirichlet boundary:

$$-\int_{\Omega} (\Delta u)v \, dx = \int_{\Omega} \nabla u \cdot \nabla v \, dx - \underbrace{\int_{\partial\Omega} \frac{\partial u}{\partial n} v \, ds}_{=0}$$

We find that:

$$\int_{\Omega} \nabla u \cdot \nabla v \, dx = \int_{\Omega} f v \, dx$$

The variational problem (ii)

Find $u \in V$ such that

$$\int_{\Omega} \nabla u \cdot \nabla v \, dx = \int_{\Omega} f v \, dx$$

for all $v \in \hat{V}$

The trial space V and the test space \hat{V} are (here) given by

$$V = \{v \in H^1(\Omega) : v = u_0 \text{ on } \partial\Omega\}$$

$$\hat{V} = \{v \in H^1(\Omega) : v = 0 \text{ on } \partial\Omega\}$$

From continuous (ii) to discrete (iii) problem

We approximate the continuous variational problem with a discrete variational problem posed on finite dimensional subspaces of V and \hat{V} :

$$V_h \subset V$$

$$\hat{V}_h \subset \hat{V}$$

Find $u_h \in V_h \subset V$ such that

$$\int_{\Omega} \nabla u_h \cdot \nabla v \, dx = \int_{\Omega} f v \, dx$$

for all $v \in \hat{V}_h \subset \hat{V}$

From discrete variational problem (iii) to discrete system of equations (iv)

Choose a basis for the discrete function space:

$$V_h = \text{span} \{ \phi_j \}_{j=1}^N$$

Make an ansatz for the discrete solution:

$$u_h = \sum_{j=1}^N U_j \phi_j$$

Test against the basis functions:

$$\int_{\Omega} \nabla \underbrace{\left(\sum_{j=1}^N U_j \phi_j \right)}_{u_h} \cdot \nabla \phi_i \, dx = \int_{\Omega} f \phi_i \, dx$$

From discrete variational problem (iii) to discrete system of equations (iv), contd.

Rearrange to get:

$$\sum_{j=1}^N U_j \underbrace{\int_{\Omega} \nabla \phi_j \cdot \nabla \phi_i \, dx}_{A_{ij}} = \underbrace{\int_{\Omega} f \phi_i \, dx}_{b_i}$$

A linear system of equations:

$$AU = b$$

where

$$A_{ij} = \int_{\Omega} \nabla \phi_j \cdot \nabla \phi_i \, dx \quad (1)$$

$$b_i = \int_{\Omega} f \phi_i \, dx \quad (2)$$

The canonical abstract problem

(i) Partial differential equation:

$$\mathcal{A}u = f \quad \text{in } \Omega$$

(ii) Continuous variational problem: find $u \in V$ such that

$$a(u, v) = L(v) \quad \text{for all } v \in \hat{V}$$

(iii) Discrete variational problem: find $u_h \in V_h \subset V$ such that

$$a(u_h, v) = L(v) \quad \text{for all } v \in \hat{V}_h$$

(iv) Discrete system of equations for $u_h = \sum_{j=1}^N U_j \phi_j$:

$$AU = b$$

$$A_{ij} = a(\phi_j, \phi_i)$$

$$b_i = L(\phi_i)$$

Important topics

- *How to choose V_h ?*
- *How to compute A and b*
- *How to solve $AU = b$?*
- *How large is the error $e = u - u_h$?*
- Extensions to nonlinear problems

How to choose V_h

Finite element function spaces

The finite element definition (Ciarlet 1975)

A finite element is a triple $(T, \mathcal{V}, \mathcal{L})$, where

- the domain T is a bounded, closed subset of \mathcal{R}^d (for $d = 1, 2, 3, \dots$) with nonempty interior and piecewise smooth boundary
- the space $\mathcal{V} = \mathcal{V}(T)$ is a finite dimensional function space on T of dimension n
- the set of degrees of freedom (nodes) $\mathcal{L} = \{\ell_1, \ell_2, \dots, \ell_n\}$ is a basis for the dual space \mathcal{V}' ; that is, the space of bounded linear functionals on \mathcal{V}

The finite element definition (Ciarlet 1975)

T

\mathcal{V}

\mathcal{L}

$$v(\bar{x})$$

$$v(\bar{x}) \cdot n$$

$$\int_T v(x)w(x) \, dx$$

The linear Lagrange element: $(T, \mathcal{V}, \mathcal{L})$

- T is a line, triangle or tetrahedron
- \mathcal{V} is the first-degree polynomials on T
- \mathcal{L} is point evaluation at the vertices

The linear Lagrange element: \mathcal{L}

The linear Lagrange element: V_h

The quadratic Lagrange element: $(T, \mathcal{V}, \mathcal{L})$

- T is a line, triangle or tetrahedron
- \mathcal{V} is the second-degree polynomials on T
- \mathcal{L} is point evaluation at the vertices and edge midpoints

The quadratic Lagrange element: \mathcal{L}

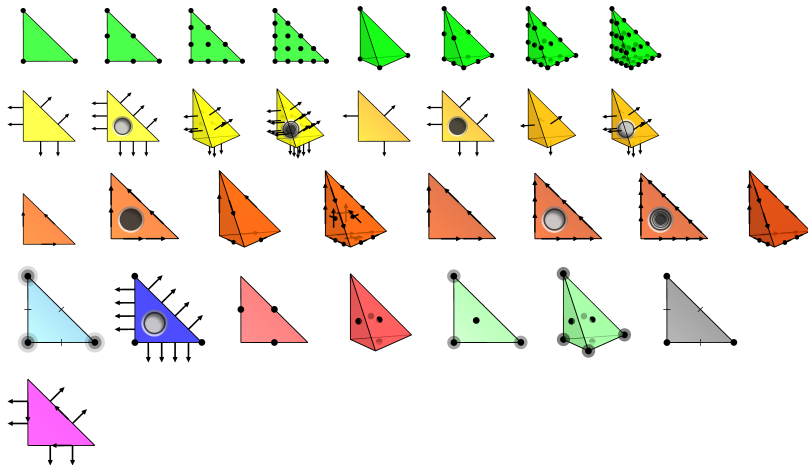

The quadratic Lagrange element: V_h

Families of elements

Families of elements

Computing the sparse matrix A

Naive assembly algorithm

$A = 0$

for $i = 1, \dots, N$

for $j = 1, \dots, N$

$A_{ij} = a(\phi_j, \phi_i)$

end for

end for

The element matrix

The global matrix A is defined by

$$A_{ij} = a(\phi_j, \phi_i)$$

The *element matrix* A_T is defined by

$$A_{T,ij} = a_T(\phi_j^T, \phi_i^T)$$

The local-to-global mapping

The global matrix ι_T is defined by

$$I = \iota_T(i)$$

where I is the *global index* corresponding to the *local index* i

The assembly algorithm

$A = 0$

for $T \in \mathcal{T}$

 Compute the element matrix A_T

 Compute the local-to-global mapping ι_T

 Add A_T to A according to ι_T

end for

Adding the element matrix A_T

Solving $AU = b$

Direct methods

- Gaussian elimination
 - Requires $\sim \frac{2}{3}N^3$ operations
- LU factorization: $A = LU$
 - Solve requires $\sim \frac{2}{3}N^3$ operations
 - Reuse L and U for repeated solves
- Cholesky factorization: $A = LL^\top$
 - Works if A is symmetric and positive definite
 - Solve requires $\sim \frac{1}{3}N^3$ operations
 - Reuse L for repeated solves

Iterative methods

Krylov subspace methods

- GMRES (Generalized Minimal RESidual method)
- CG (Conjugate Gradient method)
 - Works if A is symmetric and positive definite
- BiCGSTAB, MINRES, TFQMR, ...

Multigrid methods

- GMG (Geometric MultiGrid)
- AMG (Algebraic MultiGrid)

Preconditioners

- ILU, ICC, SOR, AMG, Jacobi, block-Jacobi, additive Schwarz, ...

See also PETSc manual for their practical use:

<https://www.mcs.anl.gov/petsc/petsc-current/docs/manual.pdf>

Which method should I use?

Rules of thumb

- Direct methods for small systems
- Iterative methods for large systems
- Break-even at ca 100–1000 degrees of freedom
- Use a symmetric method for a symmetric system
 - Cholesky factorization (direct)
 - CG (iterative)
- Use a multigrid preconditioner for Poisson-like systems
- GMRES with ILU preconditioning is a good default choice

Norms and apriori error estimations

Measuring functions: norms

Commonly used (semi-)norms

Let $u : x \in \Omega \subset \mathcal{R}^n \rightarrow u(x) \mathcal{R}^m$ be a generic function:

- sup-norm:

$$\|u\|_{\infty, \Omega} = \sup_{\Omega} |u(x)|$$

- L^2 -norm:

$$\|u\|_{0, \Omega} = \sqrt{\int_{\Omega} u(x) \cdot u(x) dx}$$

- H^1 -norm:

$$\|u\|_{1, \Omega} = \sqrt{\int_{\Omega} u(x) \cdot u(x) + \int_{\Omega} \nabla u(x) \cdot \nabla u(x)} \equiv \sqrt{\int_{\Omega} \nabla u(x) \cdot \nabla u(x) dx}$$

- Energy norm for the variational problem $\min_u \frac{1}{2}a(u, u) - l(u)$:

$$\|u\|_E = \sqrt{\frac{a(u, u)}{2}}$$

Measuring functions

Exemple in FEniCS

Let $u : x \in \Omega \subset \mathcal{R}^n \rightarrow u(x)\mathcal{R}^m$ be a generic function:

- L^2 -norm:

$$\|u\|_{0,\Omega} = \sqrt{\int_{\Omega} u(x) \cdot u(x) dx}$$

```
integral = assemble(inner(u,u)*dx)
norm_L2 = sqrt(integral)
```

Theory can help you to validate your implementation!

A priori estimates for the Poisson problem (or Linear elasticity)

If

- $u \in H_0^1(\Omega) \cap H^{k+1}(\Omega)$
- $V_h = \{v_h \in C(\Omega) : v_h \in P^k(T) \forall T \in \mathcal{T}\}$

then

$$E_1(h) := \|u - u_h\|_{1,\Omega} \leq Ch^k \|u\|_{k+1,\Omega}$$

$$E_0(h) := \|u - u_h\|_{0,\Omega} \leq Ch^{k+1} \|u\|_{k+1,\Omega}$$

where $\|\cdot\|_{l,\Omega} = \|\cdot\|_{H^l(\Omega)}$ for $l = 0, 1, k+1$.

Taking log on each side

$$\log(E_1(h)) \leq \log(Ch^k \|u\|_{k+1,\Omega}) = k \log(h) + \log(C \|u\|_{k+1,\Omega})$$

Method of manufactured solutions

Recipe

- 1 Take a suitable function u
- 2 Compute $-\Delta u$ to obtain f
- 3 Compute boundary values (trivial if only Dirichlet boundary conditions are used)
- 4 Solve the corresponding variational problem

$$a(u_h, v) = L(v)$$

for a sequence of meshes Ω_h and compute the error $E_i(h) = \|u - u_h\|_{i, \Omega_i}$ for $i = 0, 1$

- 5 Plot $\log(E_i(h))$ against $\log(h)$ and determine k

Exercise

See TP 1.2

Types of error estimators

- *A priori* estimates

(from mathematical analysis before calculating the solution):

$$\|u - u_h\| \leq Ch^k \|u\|_{\Omega, k+1}$$

This requires that the data are "regular". See Chap 6 in the Szabo-Babuska book for understanding the issues with "singularities":

https://classes.engineering.wustl.edu/2009/fall/mase5510/Chapter_6.pdf.

- *A posteriori* estimates (based on the postprocessing of the solution):
 - Explicit residual-based error estimators
 - Implicit error estimator based on local problems
 - Gradient recovery estimators
 - Hierarchic error estimators
 - Goal-oriented error estimators

A priori estimates

If $u \in H^{k+1}(\Omega)$ and $V_h = P^k(\mathcal{T}_h)$ then

$$\|u - u_h\| \leq Ch^k \|u\|_{\Omega, k+1}$$

$$\|u - u_h\|_{L^2(\Omega)} \leq Ch^{k+1} \|u\|_{\Omega, k+1}$$

These estimates are based on the regularity of the solution: it can be worst than this in the presence of singularities!!

A priori estimates

If $u \in H^{k+1}(\Omega)$ and $V_h = P^k(\mathcal{T}_h)$ then

$$\|u - u_h\| \leq Ch^k \|u\|_{\Omega, k+1}$$

$$\|u - u_h\|_{L^2(\Omega)} \leq Ch^{k+1} \|u\|_{\Omega, k+1}$$

These estimates are based on the regularity of the solution: it can be worst than this in the presence of singularities!!

A priori estimates

If $u \in H^{k+1}(\Omega)$ and $V_h = P^k(\mathcal{T}_h)$ then

$$\|u - u_h\| \leq Ch^k \|u\|_{\Omega, k+1}$$

$$\|u - u_h\|_{L^2(\Omega)} \leq Ch^{k+1} \|u\|_{\Omega, k+1}$$

These estimates are based on the regularity of the solution: it can be worst than this in the presence of singularities!!

Linear elasticity

Linear elasticity

The variational problem for linear isotropic elasticity is the following:
Find $u \in \mathcal{C} \equiv \{u : H^1(\Omega), \underline{u} = \underline{\bar{u}} \text{ on } \partial_u \Omega\}$ such that

$$\int_{\Omega} \underline{\underline{\sigma}}(\underline{\underline{\varepsilon}}(\underline{u})) : \underline{\underline{\varepsilon}}(\underline{v}) \, d\underline{x} = \int_{\partial\Omega_f} \underline{T} \cdot \underline{v} \, ds + \int_{\partial\Omega} \underline{b} \cdot \underline{v} \, d\underline{x} \quad (3)$$

$\forall v \in \mathcal{C}_0 \equiv \{u : H^1(\Omega), \underline{u} = \underline{0} \text{ on } \partial_u \Omega\}$
where

$$\underline{\underline{\sigma}}(\underline{\underline{\varepsilon}}) = \lambda \operatorname{tr}(\underline{\underline{\varepsilon}}) \underline{I} + 2\mu \underline{\underline{\varepsilon}}, \quad \varepsilon(u) = \operatorname{sym}(\nabla u)$$

.

Homework:

- ① Consider the energy functional

$$\mathcal{E}(\underline{u}) = \int_{\Omega} \frac{1}{2} \underline{\underline{\sigma}}(\underline{\underline{\varepsilon}}(\underline{u})) : \underline{\underline{\varepsilon}}(\underline{u}) \, d\underline{x} - \int_{\partial\Omega_f} \underline{T} \cdot \underline{u} \, ds - \int_{\partial\Omega} \underline{b} \cdot \underline{u} \, d\underline{x}.$$

Show that the variational formulation for linear elasticity is equivalent to the stationarity condition

$$\mathcal{E}'(\underline{u})(\underline{v}) = 0, \quad \forall \underline{u} \in \mathcal{C}_0, \quad \text{with } \mathcal{E}'(\underline{u})(\underline{v}) = \left. \frac{d\mathcal{E}(\underline{u} + h\underline{v})}{dh} \right|_{h=0}.$$

- ② What is the physical interpretation of \underline{b} , \underline{T} , \underline{u} ?
- ③ After a Galerkin approximation, the associated discrete problem will be in the form

$$AU = b$$

Following the procedure illustrated in class for the scalar Poisson equation, give the expression of A_{ij} , b_j , U_i in the case of linear elasticity. How to account for Dirichlet BC's?
